Fifteenth CERES-II Science Team Meeting

Newport News, Virginia

26-28 April 2011

Climate Science Branch, NASA Langley Research Center

Background (Page 1)

CERES uses several surface-only flux algorithms to compute SW and LW surface fluxes in conjunction with the detailed model used by SARB. These algorithms include:

LPSA/LPLA:
Langley Parameterized
SW/LW Algorithm

| | | Model A | Model B | Model C |
|----|---------|------------------------|---------|-----------|
| SW | Clear | Li et al. | LPSA | -- |
| | All-Sky | -- | LPSA | -- |
| LW | Clear | Inamdar and Ramanathan | LPLA | Zhou-Cess |
| | All-Sky | -- | LPLA | Zhou-Cess |

Background (Page 2)

- The SOFA LW & SW Models are based on rapid, highly parameterized TOA-to-surface transfer algorithms to derive surface fluxes.
- LW Models A & B as well as SW Model A were incorporated at the start of the CERES project.
- SW Model B was adapted for use in the CERES processing shortly before the launch of TRMM.
- The Edition 2B LW & SW surface flux results underwent extensive validation (See: Kratz et al. 2010), and can be used to provide independent verification of the SARB results.
- The ongoing validation process has already led to improvements to the LW models (Gupta et al., 2010).
- LW Model C will be introduced in Edition 4 processing to maintain two independent LW algorithms after the CERES Window Channel is replaced in future versions of the CERES instrument.

Status of LW Models as of January 2010

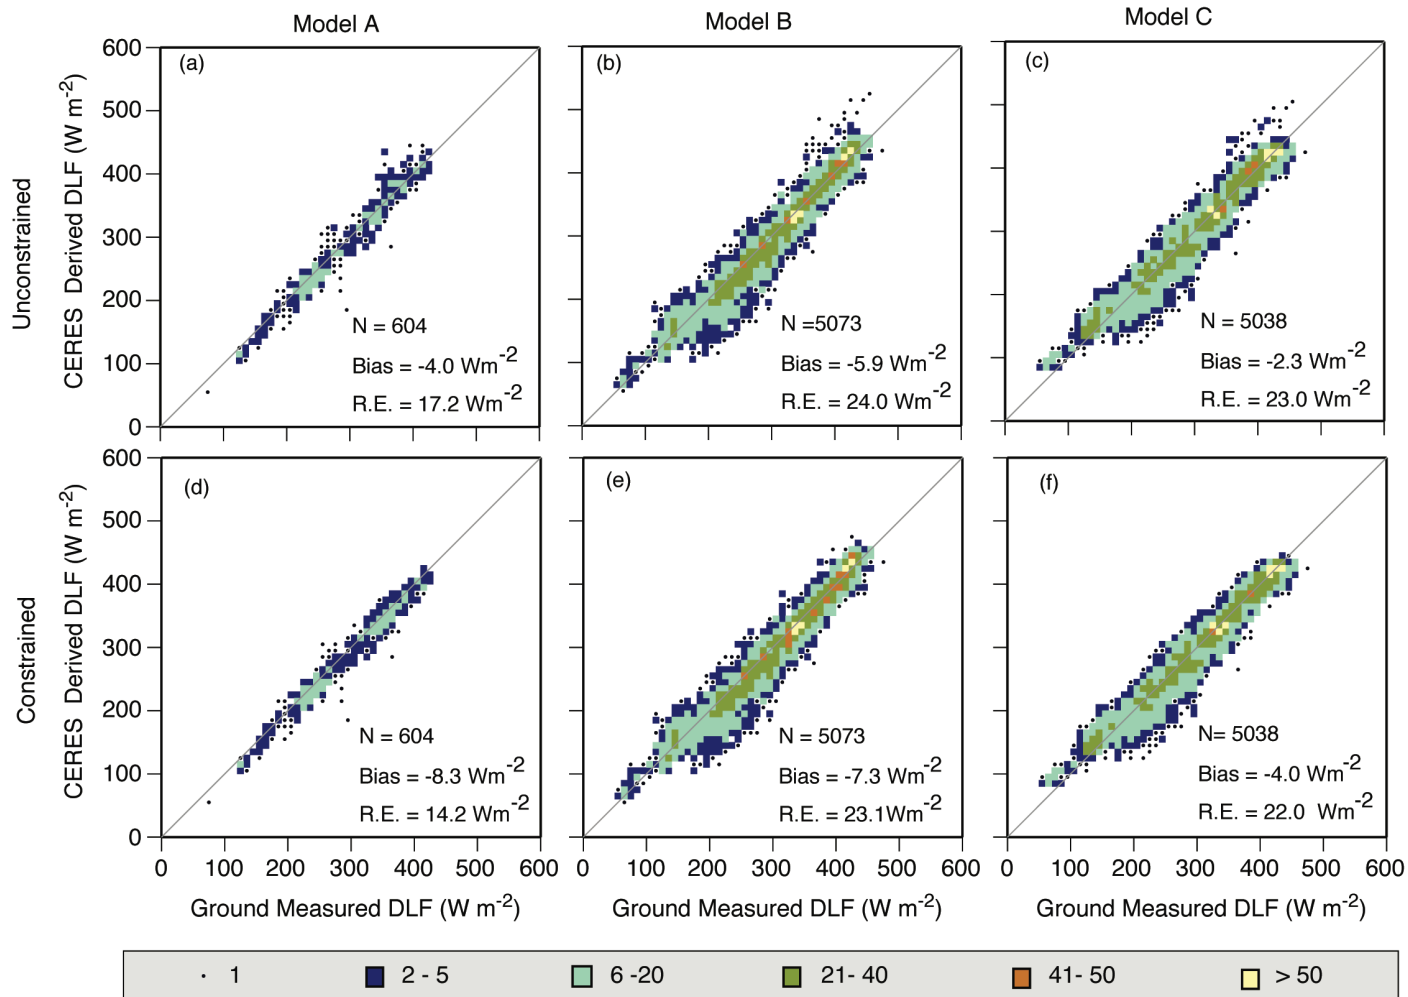

- Validation of LW Models A & B reported by Kratz et al. (2010).
- LW Model A provides very good clear-sky results for most validation sites; however, the polar sites yield a modest negative bias due to a known discrepancy at low water vapor amounts.
- LW Models B & C provide very good clear-sky and all-sky results for all of the validation sites that have been considered.
- LW Models A, B & C tend to overestimate downward surface fluxes for conditions where the surface temperatures significantly exceed the lowest layer air temperature, and underestimate downward surface fluxes for conditions where inversions exist.

Temperature Profiles for Various Conditions

Results of applying the high T_s constraint in the LW Models [Maximum lapse rate in the lowest layer = 10K/100hPa]

Gupta et al (2010)

January & July 2004

Climate Science Branch, NASA Langley Research Center

Monthly mean (solid line) atmospheric temperature profiles from 2 m above surface to 30 km above MSL over the South Pole (The dashed lines show the 10th and 90th percentiles of temperature at each height). Figure adopted from Hudson and Brandt (2005), *J. Climate*, **18**, 1673-1696.

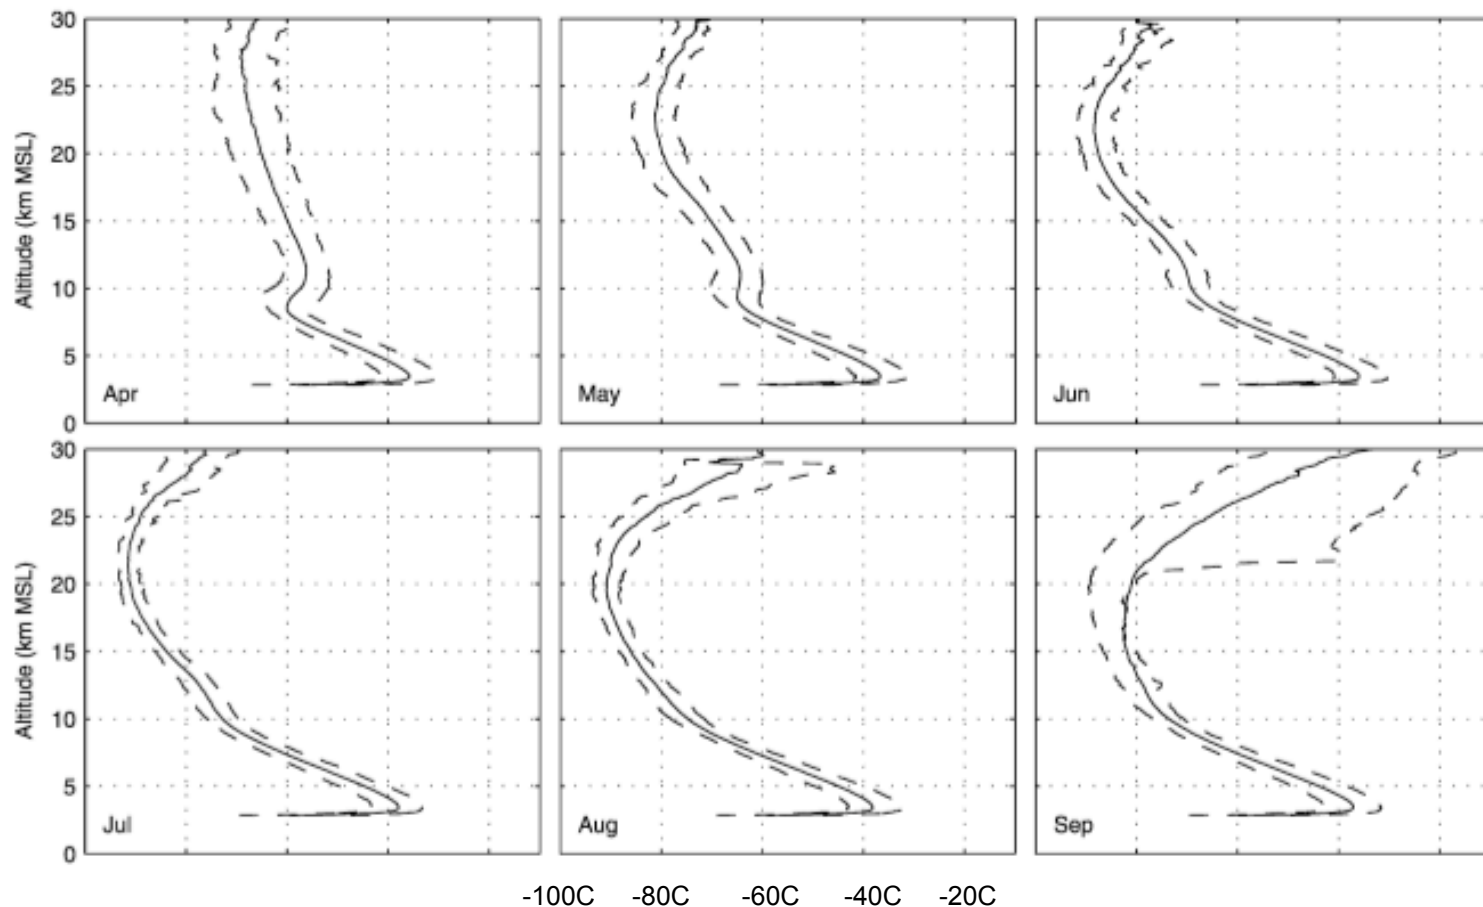

Chart of recent test cases run to improve the accuracy of the LW Models

| Designation | High Temp Constraint | Inversion T_{con} Value (Range 1) | Inversion T_{con} Value (Range 2) | Inversion T_{con} Value (Range 3) | Notes on Inversions |
|---------------------|----------------------|-------------------------------------|-------------------------------------|-------------------------------------|---------------------|
| T_{geos} (Ed T2G) | | | | | 1 |
| Ts | 10K in L1 | | | | 2 |
| Ts0 | 10K in L1 | 0K (<0K) | | | 3 |
| Ts0a (Ed 3A) | 10K in L1 | 0K or no limit (<0K) | | | 4 |
| Ts41 | 10K in L1 | 0K (0K to -10K) | -10K (-10K to -20K) | -20K (<-20K) | 5 |
| Ts42 | 10K in L1 | 0K (0K to -10K) | -10K (<-10K) | | 6 |
| Ts43 (Ed 4) | 10K in L1 | -xK (0K to -10K) | -10K (<-10K) | | 7 |

Note 1: Surface temperature is provided through GEOS 5.2.0 for Editions Terra 2G and Aqua 2D

Note 2-7: The high surface temperature constraint of 10K within the first layer (L1) is applied to all of the following calculations, which use GEOS 5.2.0 as the base case.

Note 2: All inversions are allowed (No inversion correction applied).

Note 3: No inversions are allowed.

Note 4: No inversions are allowed except at the poles where inversions are not limited.

Note 5: Inversions from 0K to -10K are reset to 0K, inversions from -10K to -20K are reset to -10K, and inversions beyond -20K are reset to -20K.

Note 6: Inversions from 0K to -10K are reset to 0K, and inversions beyond -10K are reset to -10K.

Note 7: Inversions from 0K to -10K keep their initial value, and inversions beyond -10K are reset to -10K.

Climate Science Branch, NASA Langley Research Center

Comparison between CERES Terra Editions 2G and 3A for 2008

LW Model A code changes between Editions 2G to 3A include:

- 1) A constraint method to prevent super-adiabatic lapse rates and
- 2) A constraint method to prevent inversions except for polar regions and high altitude cases.

Case 4 versus Case 1

Climate Science Branch, NASA Langley Research Center

Comparison between CERES Terra Editions 2G and 3A for 2008

LW Model B code changes between Editions 2G to 3A include:

- 1) A constraint method to prevent super-adiabatic lapse rates and
- 2) A constraint method to prevent inversions except for polar regions and high altitude cases.

Case 4 versus Case 1

Climate Science Branch, NASA Langley Research Center

Comparison between CERES Terra Editions 2G and 3A for 2008

LW Model A code changes between Editions 2G to 3A include:

- 1) A constraint method to limit inversions of 10K rather than a constraint method to prevent inversions except for polar regions and high altitude cases.

January & July 2008

Case 7 versus Case 4

Climate Science Branch, NASA Langley Research Center

Comparison between CERES Terra Editions 3A and 4A for 2008

LW Model B code changes between Editions 3A to 4A include:

- 1) A constraint method to limit inversions to 10K rather than a constraint method to prevent inversions except for polar regions and high altitude cases.

January & July 2008

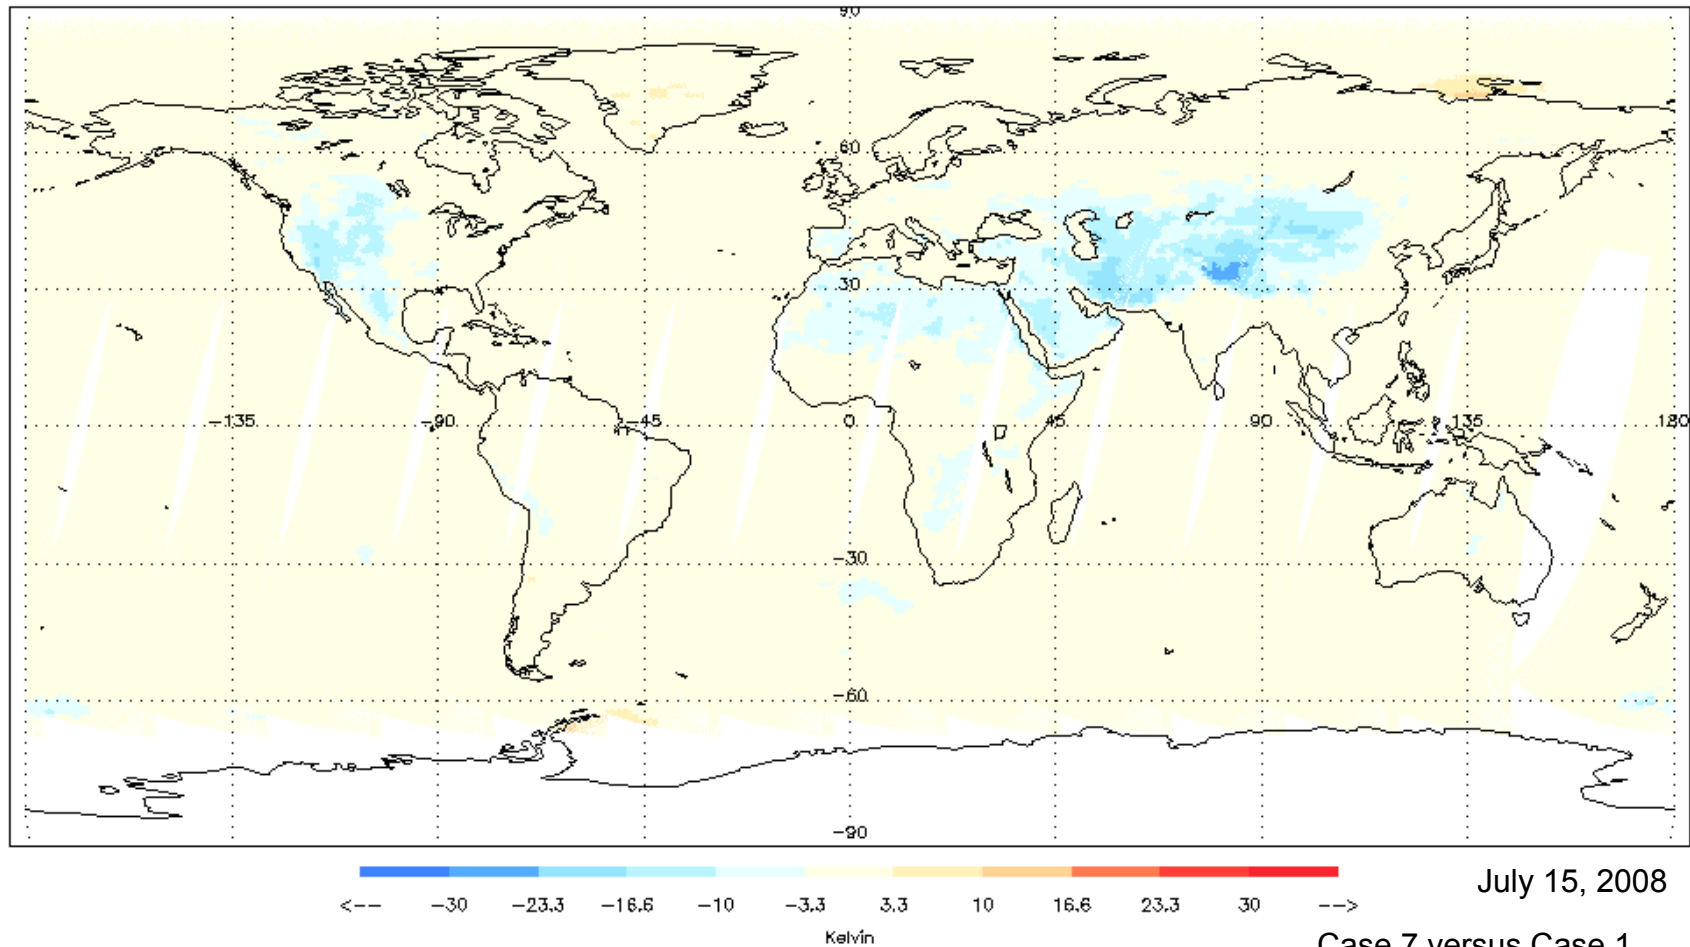

Case 7 versus Case 4

Climate Science Branch, NASA Langley Research Center

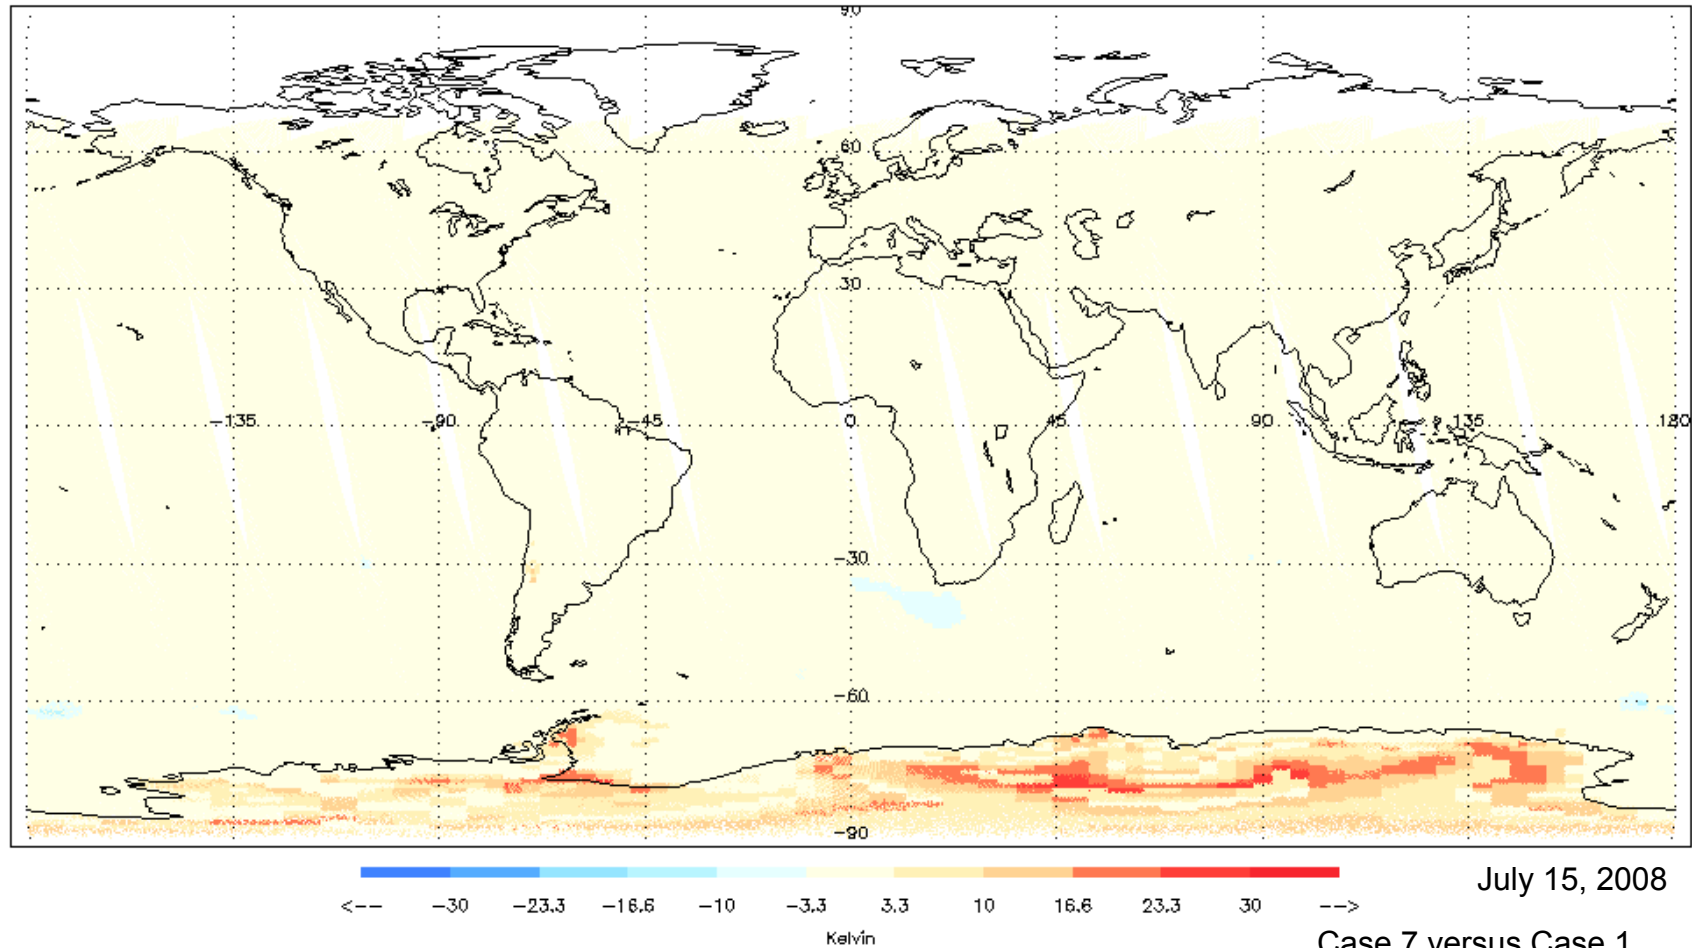

Near-surface temperature (day) differences between 1) retrievals with constraints that prevent super-adiabatic lapse rates and inversions greater than 10K, and 2) retrievals with no constraints

Climate Science Branch, NASA Langley Research Center

Near-surface temperature (night) differences between 1) retrievals with constraints that prevent super-adiabatic lapse rates and inversions greater than 10K, and 2) retrievals with no constraints

Climate Science Branch, NASA Langley Research Center

Results of Recent LW Model Improvements

To improve upon the accuracy of the LW Models, methods have been formulated to constrain the near-surface air temperature for the downward flux calculations to allow for the effective management of two extreme conditions in LW Models A, B & C:

- 1) For the condition involving surface temperatures that greatly exceed the overlying air temperatures, constraining the lapse rate to 10 K/100 hPa (roughly the dry adiabatic lapse rate) has significantly improved the results, see Gupta et al. (2010).
- 2) For conditions involving surface temperatures that are much below the overlying air temperatures (strong inversions), limiting the inversion to a maximum of 10 K/100 hPa for the downward flux calculations provides the best results for all conditions, including the high altitude, low water vapor cases seen during the winter at the Antarctic Plateau. For these cases, the air temperatures immediately above the surface are not representative of the atmospheric emission to the surface.

Status of SW Models as of January 2010

- Validation of SW Models A & B reported by Kratz et al. (2010).
- SW Model A provides satisfactory global flux retrievals, though there remain problems with cloud contamination and significant flux underestimations for conditions with low water vapor amounts.
- SW Model B has been improved significantly, yielding very good results for clear through partly cloudy conditions; however, mostly cloudy to overcast conditions still yield a high bias.

SW Model B Algorithm Improvements for Edition 4 and beyond

- Replace the WCP-55 aerosol properties in SW Model B with the MATCH aerosol optical depths and the OPAC single scattering albedos and asymmetry parameters. ✓
- Revise the Rayleigh scattering formulation in SW Model B (See Bodhaine et al. (1999): *J. Atmos. Oceanic Tech.*, **16**, 1854-1861). ✓
- Examine the relationship between clear and cloudy-sky results.
- Incorporate daily aerosol properties into SW Model B to account for the short term variability of aerosol properties.

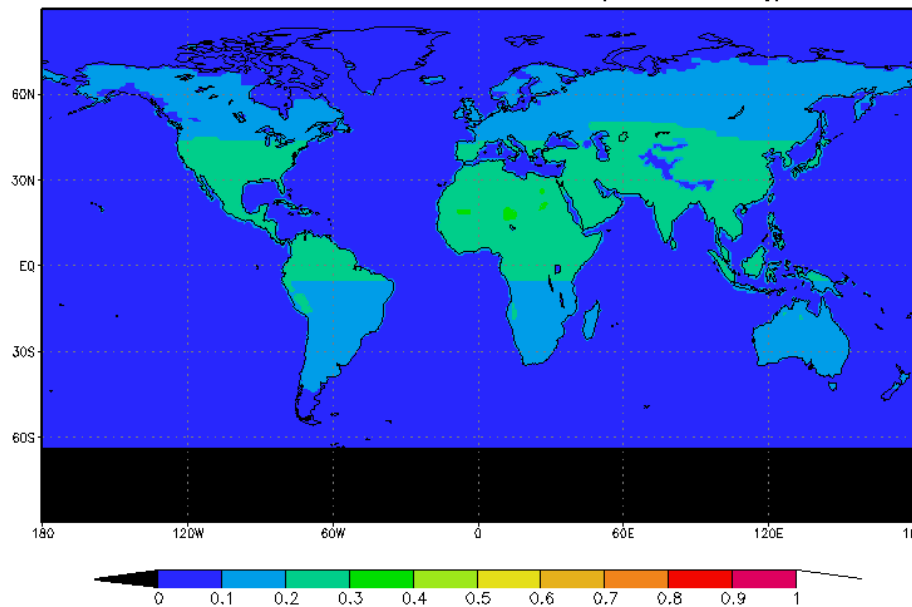

Comparison of WCP-55 and MATCH Aerosol Optical Depths

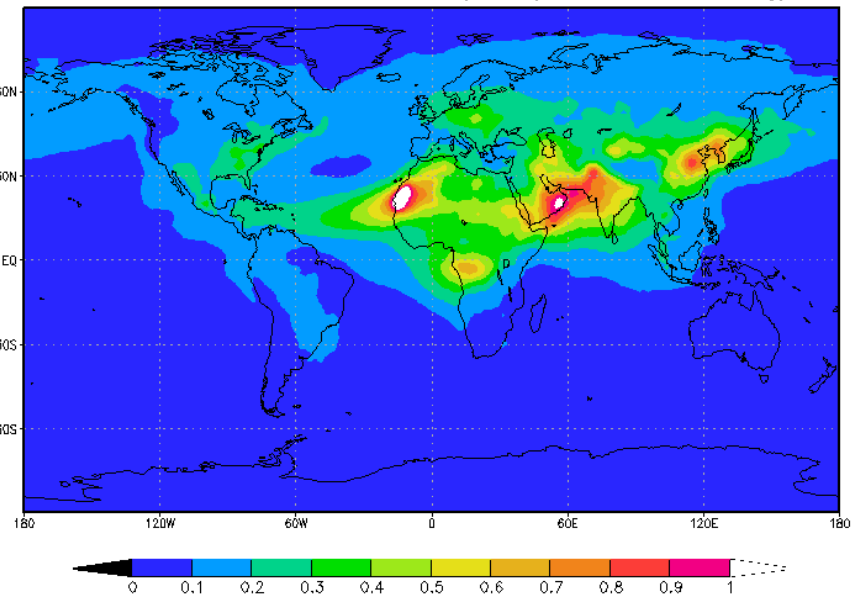

The MATCH aerosols provide a more realistic distribution of aerosol optical depths than the WCP-55 aerosols

Note: Also use OPAC single scattering albedos and asymmetry parameters

Baseline

New Rayleigh and New Aerosols

January & July 2004 results

Climate Science Branch, NASA Langley Research Center

Comparison between surface-measured and CERES-derived fluxes: Overcast

Overcast (> 99.9% cloudy) sky results for comparisons among the results for a) WCP-55 aerosols & old Rayleigh algorithm, b) WCP-55 aerosols & new Rayleigh algorithm, c) MATCH aerosols & old Rayleigh algorithm, and d) MATCH aerosols & new Rayleigh algorithm.

For the overcast (> 99.9% cloudy) sky case, the new formulation with the MATCH aerosols & the new Rayleigh algorithm shows no improvement.

January & July 2004 results

Climate Science Branch, NASA Langley Research Center

Results of Recent SW Model Improvements and Course of Action for the Future

Simultaneously replacing the original WCP-55 aerosols with the MATCH aerosols, and the original Rayleigh molecular scattering formulation with an improved Rayleigh molecular scattering formulation has significantly improved the surface SW flux calculations for clear through partly cloudy sky conditions.

Results for the mostly cloudy to overcast conditions strongly suggest that further work on the cloud transmittance calculation is necessary. Our attention is currently focused on the formulae used for the cloud transmittance and the overcast albedo.

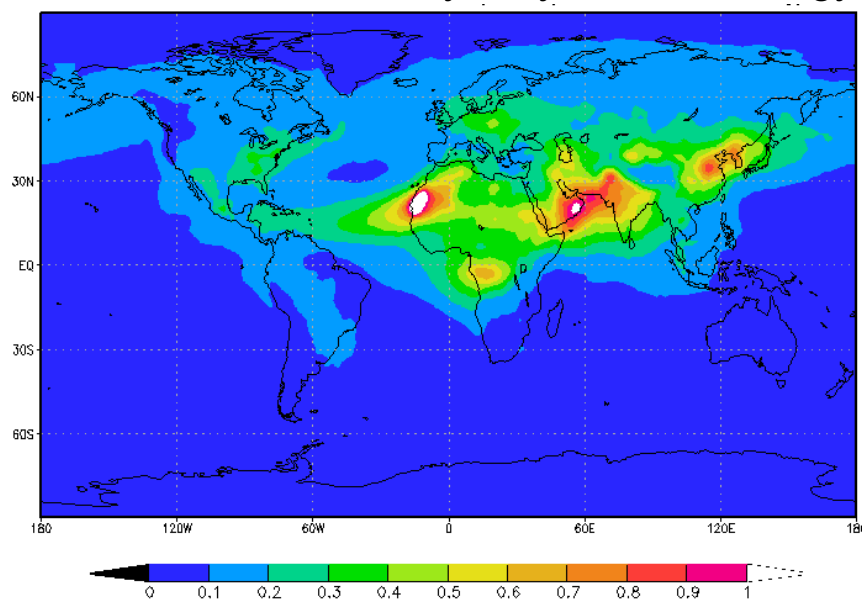

To account for the short term variability of aerosol properties, we plan to examine the feasibility of incorporating the daily aerosol properties into SW Model B.

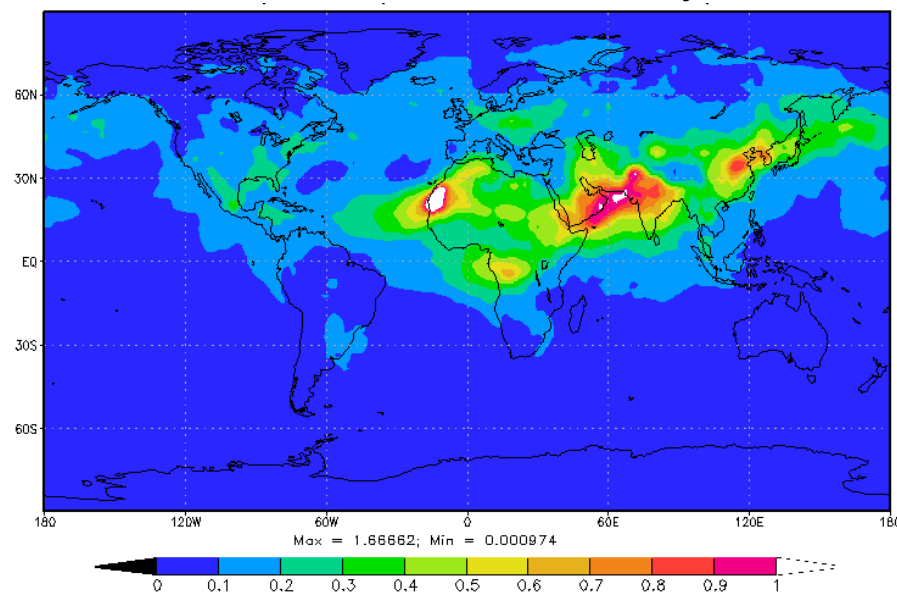

Comparison of MATCH Aerosol Optical Depths from Monthly Climatology to an Individual Month

The plot of the 10-year Climatology is representative
of an individual month within that 10-year period.

MATCH BB AOD July 10-year Climatology

MATCH Broadband AOD July 2008

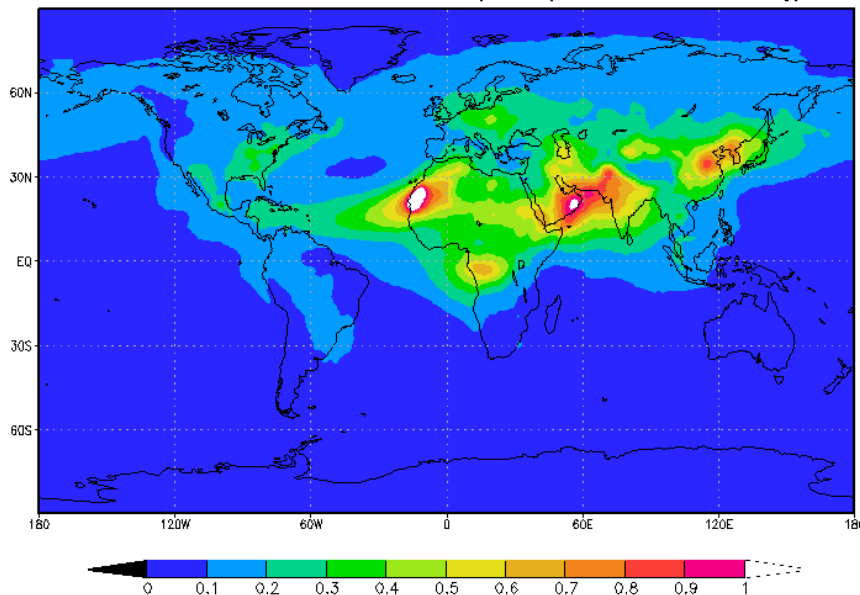

Climate Science Branch, NASA Langley Research Center

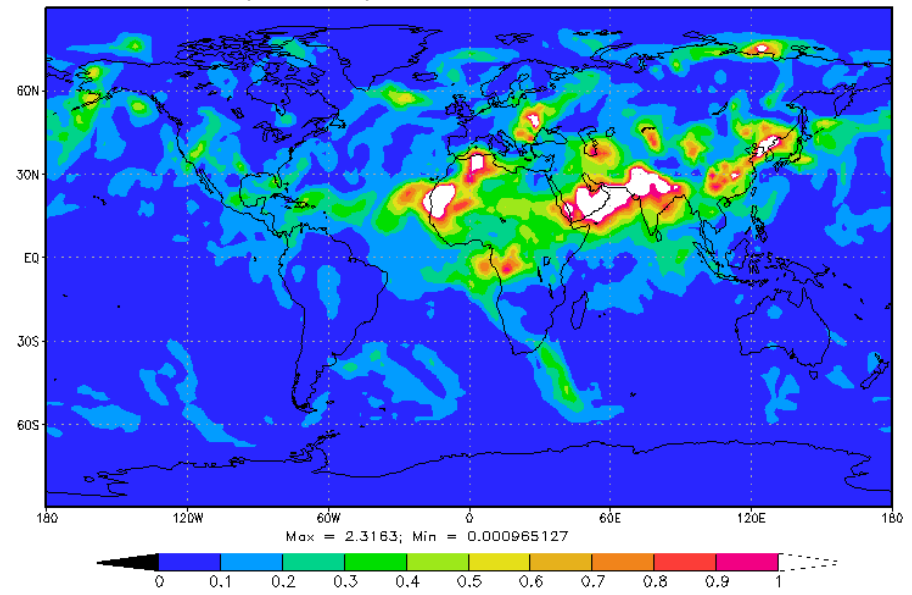

Comparison of MATCH Aerosol Optical Depths from Monthly Climatology to an Individual Day

The use of daily aerosol optical depths should allow for more precise retrievals, especially during periods with atypical aerosol loadings. In this plot an individual day of MATCH data is used to represent MODIS-derived broadband data.
